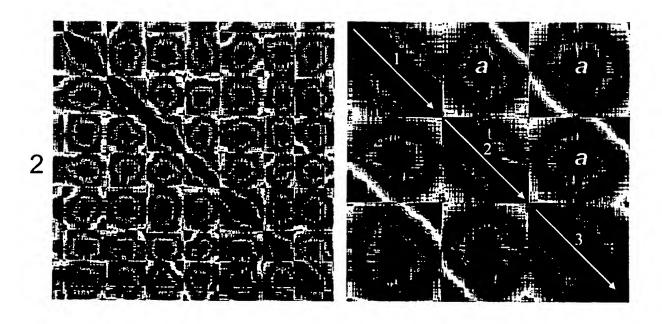

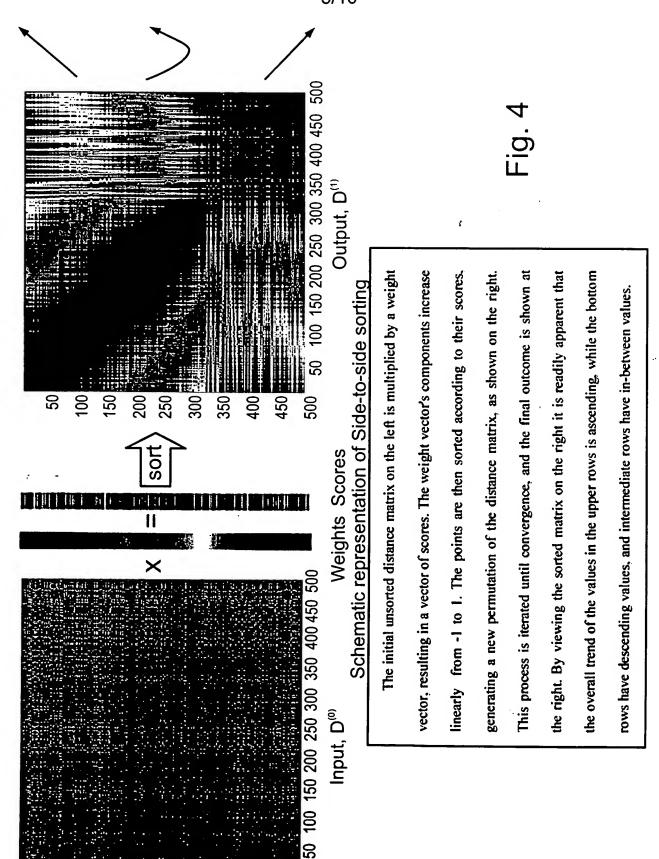

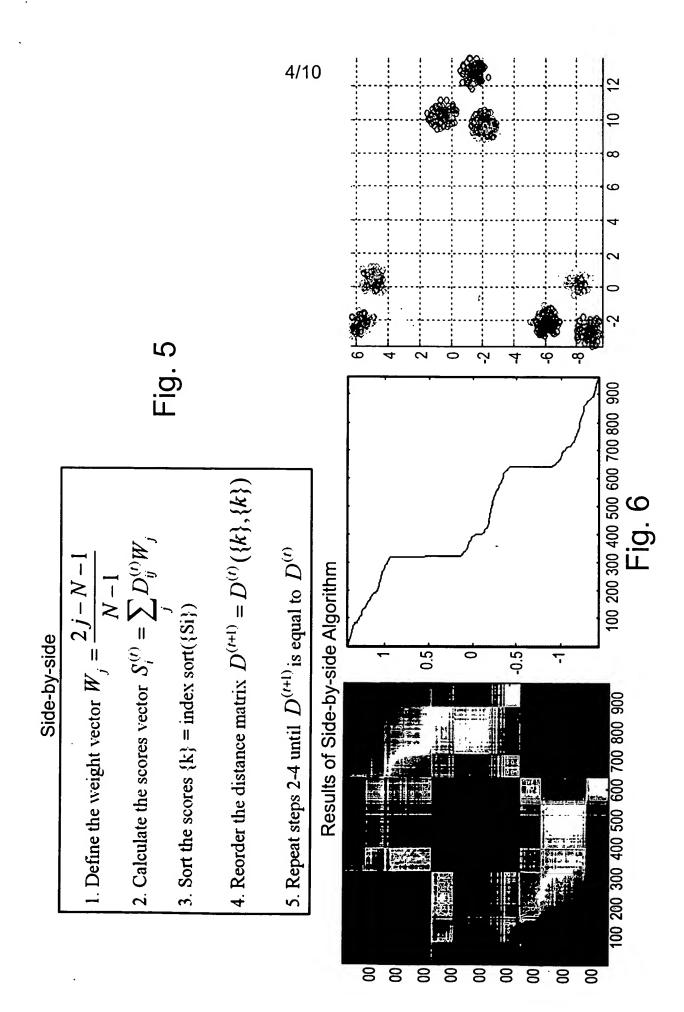

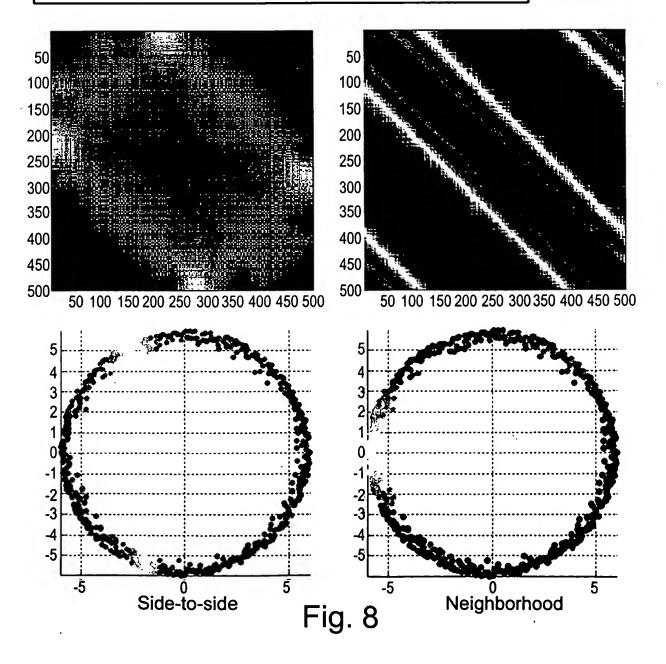

Fig. 3

- 1. Define the weight matrix  $W_{ij} = e^{\frac{-(i-j)^2}{\varepsilon \cdot N}} / \sum_{k} e^{\frac{-(k-j)^2}{\varepsilon \cdot N}}$
- 2. Calculate the mismatch matrix  $M_{ij}^{(t)} = \sum_{k} D_{ik}^{(t)} W_{kj}$
- 3. Extract score vector  $S_i = \arg\min_{j}(M_{ij})$
- 4. Sort the scores  $\{k\}$  = index sort( $\{Si\}$ )
- 5. Reorder the distance matrix  $D^{(t+1)} = D^{(t)}(\{k\}, \{k\})$
- 6. Repeat steps 1-5 while adjusting ε
